Drug resistance is the reduction in effectiveness of a medication such as an antimicrobial or an antineoplastic in treating a disease or condition. The term is used in the context of resistance that pathogens or cancers have "acquired", that is, resistance has evolved. Antimicrobial resistance and antineoplastic resistance challenge clinical care and drive research.

A biofilm is a structured consortium of bacteria embedded in a self-produced polymer matrix consisting of polysaccharide, protein and DNA. Bacterial biofilms cause chronic infections because they show increased tolerance to antibiotics and disinfectant chemicals as well as resisting phagocytosis and other components of the body's defence system.

Drug-resistant tuberculosis (TB) remains a major threat to global health: Of the ten million people who fell ill with TB in 2016 alone, over half a million are estimated to have resistance to the most effective drugs used to treat TB, rifampicin and isoniazid. For those with highly resistant strains of TB, very few treatment options exist.
